

Materials Reliability in Microelectronics V: Volume 391 (MRS Proceedings)

This long-standing proceedings series is highly regarded as a premier forum for the discussion of microelectronics reliability issues. In this fifth book, emphasis is on the fundamental understanding of failure phenomena in thin-film materials. Special attention is given to electromigration and mechanical stress effects. The reliability of thin dielectrics and hot carrier degradation of transistors are also featured. Topics include: modeling and simulation of failure mechanisms; reliability issues for submicron IC technologies and packaging; stresses in thin films/lines; gate oxides; barrier layers; electromigration mechanisms; reliability issues for Cu metallizations; electromigration and microstructure; electromigration and stress voiding in circuit interconnects; and resistance measurements of electromigration damage.
