

Dynamics of Quantum Dot Lasers: Effects of Optical Feedback and External Optical Injection (Springer Theses)

This thesis deals with the dynamics of state-of-the-art nanophotonic semiconductor structures, providing essential information on fundamental aspects of nonlinear dynamical systems on the one hand, and technological applications in modern telecommunication on the other. Three different complex laser structures are considered in detail: (i) a quantum-dot-based semiconductor laser under optical injection from a master laser, (ii) a quantum-dot laser with optical feedback from an external resonator, and (iii) a passively mode-locked quantum-well semiconductor laser with saturable absorber under optical feedback from an external resonator. Using a broad spectrum of methods, both numerical and analytical, this work achieves new fundamental insights into the interplay of microscopically based nonlinear laser dynamics and optical perturbations by delayed feedback and injection.

Quantum Dot Passively Mode-Locked Lasers Subject to Optical Passively mode-locked quantum dot (QD) semiconductor lasers are . that the dynamic effects induced by optical feedback do not crucially depend on the Outside these self-locking regions satellite pulses can form, or the dynamics .. of Optical Feedback and External Optical Injection, Springer Theses (Springer, 2014). **Publications PIK Research Portal** Download Book (PDF, 15527 KB).
