

The Search for Anti-Inflammatory Drugs: Case Histories from Concept to Clinic

Perspectives on Anti-Inflammatory Drugs
Inflammation is a very complicated process of interrelated events and cas cades that does not allow for an easily defined, focused attack for drug discovery. It is evident from years of research and development that certain classes of compounds (e.g., NSAIDs, steroids, and so on) have had a meas ure of success in alleviating pain and even dampening cellularhormonal mechanisms involved in the process. Clear, mechanism-related therapies (e.g., for arthritis) and targeted drugs (e.g., for transplantation) have not been available in the past and, in reality, research in inflammation has re lied on more phenomenological approaches for resolving symptoms or on blatant cytreductive approaches in cases like organ transplantation. In the last decade, approaches that have revealed novel cellular pathways in which intervention is possible for lymphocyte regulation (for example, cyclosporine and FK506) and small molecular weight mediators (e.g., leu kotriene inhibitors) are now either standard therapy or will be in a short time. These latter approaches have been the result of research from the 1970s up to the present.
