

## The Dental cosmos Volume 47

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1905 Excerpt: ... gingival portion of the cavity, that one filling in a disto-occlusal cavity in a lower right second molar failed around the gold, the gingival half of the cavity being filled with tin and the rest with gold; the wearing down of the tooth-structure and the gold on the occlusal surface had fractured the enamel so that it broke away, and the filling began to leak around the gold. The patient allowed it to go so long that the gold was forced nearly out of the cavity. I also found that three fillings failed for about one-third the distance across the cervical margin; one filling failed at the cervical margin after it had been in six years, and another after it had been in seven years. That makes seven failures, some total and some partial, of those cases which I have been able to watch. The essayist tells you that he has used tin in the cervical portion of the cavity for four or five years, but it seems to me that thirty years is a better test than four or five. Now it may be possible that good tin foil was not used in those cases where the essayist failed. I do not know what kind of tin the essayist used, nor does he describe his method of using it, so I must conclude from what I know about this matter that either the tin foil was poor material or else the method of manipulation was faulty. Now I know that his method of manipulation of gold is complete, and no doubt the same may be said of tin, so the factor of manipulation will have to be eliminated. Then again it might happen that the preparation of the cavity was faulty, yet I think that in the cases he cited that cannot be true, because the essayist is thorough in the preparation of cavities. We are therefore compelled to fall back upon the first premise, that it was poor material. A
